

CAPSLink 4.1.0 Release Notes

Patient Profile

- Previously CAPSLink did not prevent a user from entering a future date for a patient's date of birth. This has been corrected.
- When a user left the Order List open while another user updated a patient weight, the previous weight was displayed in the Order Entry screen. This also occurred when opening an order from the Patient Profile. CAPSLink will now always pull the updated weight when a user opens an order from the Order List or Patient Profile.

Order History (503B)

- When multiple orders were placed in the same shipment only one of the orders had a tracking link. All orders will now have a UPS tracking link.

User Security

- In the event that the primary smtp server for MFA fails, a secondary server will automatically start to forward the codes for MFA. This will improve the reliability of the MFA system.
- Users that are not enabled for MFA will encounter a CAPTCHA test during the login process. This will add another layer of protection for users that are unable to utilize the MFA system.
- If a non-existent username is entered during the Forgot Password process, after the CAPTCHA challenge the prompt for the security questions will display. This will prevent hackers from using this process to determine valid usernames.
