

# CAPSLink 3.1.1 Release Notes

---

## Audit Trail

- After the release of 3.1.0 a user could only see their own changes in the audit trail. This issue has been resolved.

## MFA (Multifactor Authentication).

- When registering for MFA, CAPSLink will now perform a validation of the email address by requiring the user to enter their email twice (see fig 1). If the email addresses do not match exactly the user will be prompted to correct the email entry.

Multi-factor authentication has been enabled on this account. Please provide an e-mail address for your account below. Optionally, you may also enter your mobile phone number if you want to receive text messages with multi-factor authentication codes.

**E-mail Address (Required)**

**E-mail Address Confirmation (Required)**

**Fig 1 – Email Validation**

- An Admin user can now “Reset MFA” for a user in User Management (see fig 2 on next page). After MFA is reset, the user must go through the MFA registration process again. This is helpful if a user has chosen to receive their access code via email but does not have access to (or has forgotten) that email account. It can also be useful if a user has chosen to receive their code via SMS text or the Authenticator app and they do not have access to their phone.
